#### **Please note**

In correspondence concerning this instrument, please quote the type number and serial number as given on the type plate.

#### **Bitte beachten**

Bei Schriftwechsel über dieses Gerät wird gebeten, die Typennummer und die Gerätenummer anzugeben. Diese befinden sich auf dem Typenschild an der Rückseite des Gerätes.

#### **Noter s. v. p.**

Dans votre correspondance et dans vos réclamations se rapportant à cet appareil, veuillez toujours indiquer le numéro de type et le numéro de série qui sont marqués sur la plaquette de caractéristiques.

#### **Important**

As the instrument is an electrical apparatus, it may be operated only by trained personnel. Maintenance and repairs may also be carried out only by qualified personnel.

#### **Wichtig**

Da das Gerät ein elektrisches Betriebsmittel ist, darf die Bedienung nur durch eingewiesenes Personal erfolgen. Wartung und Reparatur dürfen nur von geschultem, fach- und sachkundigem Personal durchgeführt werden.

#### **Important**

Comme l'instrument est un équipement électrique, le service doit être assuré par du personnel qualifié. De même, l'entretien et les réparations sont à confier aux personnes suffisamment qualifiées.

**12. CODING SYSTEM OF FAILURE REPORTING FOR QUALITY**

**13. ADRESSES FOR SALES AND SERVICE**

## 1. SAFETY INSTRUCTIONS

### WARNING:

These servicing instructions are for use by qualified personnel only. To reduce the risk of electric shock, do not perform any servicing other than that specified in the Operating Instructions unless you are fully qualified to do so.

Read these pages carefully before installation and use of the instrument.

The following clauses contain information, cautions and warnings which must be followed to ensure safe operation and to retain the instrument in a safe condition.

Adjustment, maintenance and repair to the instrument shall be carried out only by qualified personnel.

### 1.1. SAFETY PRECAUTIONS

For the correct and safe use of this instrument it is essential that both operating and servicing personnel follow generally-accepted safety procedures in addition to the safety precautions specified in this manual. Specific warning and caution statements, where they apply, will be found throughout the manual. Where necessary, the warning and caution statements and/or symbols are marked on the apparatus.

### 1.2. CAUTION AND WARNING STATEMENTS

#### CAUTION:

Is used to indicate correct operating or maintenance procedures in order to prevent damage to or destruction of the equipment or other property.

#### WARNING:

Calls attention to a potential danger that requires correct procedures or practices in order to prevent personal injury.

### 1.3. SYMBOLS

Protective earth  
(grounding) terminal

(black symbol on yellow background or impressed,  
e. g. at the mains connector at the rear)

### 1.4. IMPAIRED SAFETY-PROTECTION

Whenever it is likely that safety-protection has been impaired, the instrument must be made inoperative and be secured against any unintended operation. The matter should then be referred to qualified technicians.

Safety protection is likely to be impaired if, for example, the instrument fails to perform the intended measurements or shows visible damage.

### 1.5. GENERAL CLAUSES

#### WARNING:

The opening of covers or removal of parts, except those to which access can be gained by hand, is likely to expose live parts and accessible terminals which can be dangerous to live.

The instrument shall be disconnected from all voltage sources before it is opened.

Bear in mind that capacitors inside the instrument can hold their charge even if the instrument has been separated from all voltage sources.

#### WARNING:

Any interruption of the protective earth conductor inside or outside the instrument, or disconnection of the protective earth terminal, is likely to make the instrument dangerous.

Intentional interruption is prohibited.

Components which are important for the safety of the instrument may only be renewed by components obtained through your local Philips organisation (see also chapter 9.).

After repair and maintenance in the primary circuit, safety inspection and tests, as mentioned in chapter 9 have to be performed.

## 1.6. CONNECTIONS

The circuit earth potential is applied to the external contacts of the BNC sockets and is connected to the cabinet by means of parallel-connected capacitors. By this means hum loops are avoided and a clear HF earthing is obtained.

If the circuit earth potential in a measurement set-up is different from the protective earth potential, it must be noticed,

- that the BNC sockets can be touched and that it must not be live, see the safety regulations on the subject (VDE 0411),
- that all sockets marked with the sign  $\perp$  are internally interconnected.

## 2. MAINS VOLTAGE SETTING AND FUSES

The safety instructions in previous chapters must be followed.

PM 5191: On delivery from the factory the instrument is set to 220 V – AC.  
 PM 5191 M (USA): On delivery from the factory the instrument is set to 120 V – AC.

If the instrument is to be used on a different supply voltage the wiring must be altered; the main fuse should be replaced dependent on the mains voltage. The wiring for the fan must not be altered.

### Proceed as follows:

- Loosen 2 cross-slotted screws at the rear side of the instrument (see also chapter 7.1.).
- Remove the top cover.
- Remove the isolating cover of the topside of the mains transformer, remove cable binder before.
- Alter the wiring of the mains transformer according to the connection diagram.
- Refit the isolating cover.
- If necessary, insert the advised fuse into the fuse holder instead of the fuse built-in. In this case change current label of the fuse holder.
- Change the mains voltage label at the rear of the instrument in accordance with the mains voltage selected.  
 The labels for the mains voltage, current and the fuse are enclosed in a plastic bag.
- Close the instrument.

### Connection diagram

### 3. OPERATING PRINCIPLE, Fig. 30 (Block diagram)

#### 3.1. GENERAL OPERATING PRINCIPLE

The basic functional units, performing the generation, processing and conditioning of the generator output signals, are named

- DFS, Digital Frequency Synthesizer, on unit 2
- MODULATOR on unit 1
- PULSE GENERATOR on unit 1
- AMPLIFIER on unit 1

These functional units are under control of the CPU (Central Processing Unit), consisting of a micro-processor and its peripheral components on unit 2. Primary control data for the CPU is derived from the front-end KEYBOARD & DISPLAY on unit 3 or from an external controller via the IEEE/IEC bus interface. The output-signal parameters are displayed numerically on a 7-segment-LED display. Key LEDs are provided for operating mode indication. Subsequently a brief description of the over-all block diagram (fig. 30) of the generator is given.

#### 3.2. DESCRIPTION OF THE BLOCK DIAGRAM

##### DFS

The primary signals — sine, triangular, positive and negative sawtooth waves — are generated by direct digital signal synthesis.

Binary samples of the wave are created in the SIGNAL SYNTHESIZER section and converted to analogue voltages by a fast DAC at the clock rate  $f_c$ . The output frequency  $f_o$  is directly related to  $f_c$ , according to

$$f_o = 0.1 \cdot N \cdot 2^{-33} \cdot f_c = N \cdot 10^{-4} \text{ Hz}$$

where  $N$  is the decimal equivalent of the binary frequency word, routed to the SIGNAL SYNTHESIZER from the CPU via U2-CONTROL BUS.  $f_c$  is generated by an x-tal oscillator, the 8.59 MHz CLOCK. The AUTOMATIC SWITCH alternatively routes the external clock frequency to the SIGNAL SYNTHESIZER, if this is applied to the CLOCK INPUT. The DAC output signal is smoothed by the 3 MHz LPF, an anti-aliasing low-pass filter.

##### PULSE GENERATOR

The PULSE GENERATOR basically represents an electronical switching circuitry, creating a TTL signal and a square wave, each signal with a 50 % duty cycle. The instants of the positive and negative edges of these signals are determined by the zero-crossings of the DFS signal, e.g. a sine wave, fed to the ZERO CROSSING DETECTOR as reference.

Only if square wave at the generator output is programmed, the TTL output of the ZERO CROSSING DETECTOR is routed to the SQUARE WAVE CONDITIONER by the CONTROL CIRCUITRY. The TTL OUTPUT STAGE and the SQUARE WAVE CONDITIONER are creating the TTL output voltage of the generator and the primary square wave with accurate amplitude and waveform.

## MODULATOR

By the VOLTAGE CONDITIONER the DFS sawtooth wave is halved in amplitude and shifted in dc, resulting in unipolar signals. The sine wave and the triangular wave are routed without change through the VOLTAGE CONDITIONER.

By the SELECTOR I either the output signal of the VOLTAGE CONDITIONER (sine, triangle, sawtooth) or the square wave of the PULSE GENERATOR is routed directly or through the AMPLITUDE MODULATOR to the AMPLIFIER.

In internal AM mode the modulating signal is derived from the MODULATION OSCILLATOR output. The modulating sine wave is fed to the AMPLITUDE MODULATOR through SELECTOR II. Alternatively – in the external modulation mode – the modulating signal is supplied from the generator MODULATION INPUT.

## AMPLIFIER

The vernier setting of the generator output amplitude is performed by the AMPLITUDE CONTROLLER. After amplification by the POWER AMPLIFIER the signal either directly or after 20 dB respectively 40 dB attenuation by the STEP ATTENUATOR is routed to the OUTPUT socket. The DC GENERATOR adds the programmed dc voltage.

## CPU

An 8-bit microprocessor (8031) and a 10 MHz clock are the constituents of the PROCESSOR & CLOCK. The PROGRAM MEMORY is a 8 Kbyte EPROM. In an external data memory, the 128 byte RAM, the storage register contents of the generator are stored. By the CONTROL BUS DRIVER the required load capability of the U1- and U2 CONTROL BUS serial data line (SDA), and the clock line (SCL), is achieved. The device selecting strobe signals STR1...15 – used for CPU components and latching-data-shift registers in the various functional units controlled by the CPU – are derived from 4 ports of the PROCESSOR by the STROBE DECODER.

The IEEE/IEC bus interface of the generator consists of the IEC BUS CONTROLLER, the DEVICE ADDRESS LATCH & SHIFT REGISTER and the 3-STATE GATE & LATCH.

## 4. PERFORMANCE CHECK

### 4.1. GENERAL INFORMATION

**WARNING:**

Before switching on, ensure that the instrument has been installed in accordance with the instructions outlined in Section 2 of the Operating Manual: Installation instructions.

This procedure is intended to:

- check the instrument
- be used for incoming inspection to determine the acceptability of newly-purchased instruments and/or recently-recalibrated instruments.

**ATTENTION:**

The procedure does not check every detail of the instrument's calibration; rather, it is concerned primarily with those parts of the instrument which are essential to measurement accuracy and correct operation. Removing the instrument covers is not necessary to perform this procedure. All checks are made from the front panel.

If this test is started within a short period after switching on, bear in mind that steps may be out of specification, due to insufficient warming-up time. To avoid this situation, allow the specified warming-up time of 30 min.

### 4.2. POWER-ON SELFTEST

Immediately after power on a selftest routine is started with which PROM and RAM are tested. If an error is detected one of the following error messages appears:

ERR 1	PROM	checksum error
ERR 2	RAM	(processor) checksum error
ERR 3	RAM	checksum error; operation possible but memory contents is destroyed.

In case of no error in PROMs/RAMs all LEDs and all segments of the displays are then switched on for appr. 3s after the software version has been indicated in the 'LEVEL'-sector of the display. The instrument must then be in the on-state which is indicated by a figure in the sectors of the display according with the last setting before switched off the LED 'Hz' or 'kHz' in the display and the LEDs in the keys according with the last setting.

### 4.3. GENERAL FUNCTIONAL TEST

The function of the synthesizer can now be checked with the help of the following examples:

amplitude = 5 Vpp; offset = 0 Vdc

terminate the output with  $50 \Omega$  and connect an oscilloscope.

Wave form	Frequency	Modulation	defective unit in case of faulty function
triangle	50 kHz	OFF	DFS
sine	2 MHz	INT <small>depth 30 % Freq. 1 kHz</small>	modulator
pos. sawtooth	500 Hz	OFF	DFS / CPU
square	2 MHz	OFF	pulse generator

If one of the functions doesn't work, the diagnostic program can be a help to distinguish whether the defect is in the unit in question or in the CPU with its C-bus drivers/decoders. By selecting TEST 4 (strobe test) it is possible to check the data communication lines and the decoders of the subunits.

In case that all functions are o. k. this test must be continued by checking the output signals:

TTL OUT: This output shows always a square wave voltage with TTL-level and signal-frequency.

INT CLOCK: This output contains the clock-signal of the internal digital frequency synthesizer with TTL-level and a frequency of 8.58993 MHz.

MODULATION: This output shows a sinewave signal with an amplitude of 0.3 Vrms

## 5. DIAGNOSTIC-PROGRAM PM 5191

This test program contains 5 submodules:

- TEST 1: Display and LED test
- TEST 2: Keyboard test
- TEST 3: Storage register test
- TEST 4: Strobe test (test of the internal interfaces)
- TEST 5: Test for the IEEE/IEC-BUS interface

To activate this test program, press the key MODULATION OFF while power is switched on and keep it pressed for about 3 seconds.

The return to the main operating mode is only possible by switching power OFF and ON again.

When the test program is activated, the display shows "TEST x" where 'x' is a number from 1 to 5. This number changes continuously and slowly, and by pressing the key MODULATION OFF at the right moment, the respective test-submodule will be started.

To leave the test submodules, press the key **MODULATION OFF** for about 2 seconds.

## TEST 1 : Display and LED test

## Step 1: 7-segment-display

All display segments and LEDs are switched on for about 2 seconds.

After this the program starts to switch on one segment after the other for four display positions simultaneously. Finally, the decimal points of these four positions remain lit and the program starts to do the same with the next four display positions.

After the last four digits were tested, the program switches on all segments and LEDs and remain in this state until the key MODULATION OFF was pressed once again.

## Step 2: LEDs

All LEDs will be switched on sequentially, one after the other, for approx. 0.5 seconds beginning with the uppermost left one (inside the key sine wave). When the last LED was switched on (key  $\Delta$  LEVEL) it remains lit and the indication "End" appears at the display until the key MODULATION OFF was pressed. Then the program returns to the test-menu.

## TEST 2: Keyboard test

The display shows the indication: **1-01 - - - -**

Now you must press the first key of the first row: 1 — 01 — — —  
(row 1) — (column 1)

## Keyboard

When the right key was pressed, the display shows

1 - 01 1 1 1 1

for about 1 second and changes then to

1 - 02 - - -

as a request to press the second key in the first row. In case of a failure, the display would show

Err 1 - 01 x - xx

where x - xx indicates the wrong code (row and column). This error indication will only be reset by pressing the requested key — in case of a hardware failure at the keyboard unit it would not be possible to get the right code and thus to reset the error message.

When the last key was pressed, the keyboard test is finished and the display indicates "End". To leave this diagnostic submodule and to get back to the test menu, the key MODULATION OFF must be pressed.

### TEST 3 : Storage register test

#### Attention:

This memory test damages the register contents. When the instrument is switched on after the storage register test was executed, the display indicates "Err 3" which means that there are now no parameters in the storage register — the complete contents (parameters) are destroyed.

The display indicates

MEMO 1 -

and the program starts to write a test pattern into each location of the memory chip, reads it again, and checks this value for correctness. When no failure was detected, the same will be done with a second pattern. In case that there is no failure, the display shows

MEMO 1 - 1

and in case of a failure

MEMO 1 - 0

With MODULATION OFF the program returns to the test menu.

**TEST 4 : Strobe test**

The display indicates

STRO  $x$

where  $x$  is a number from 6 to 15. This number changes continuously and slowly. By pressing the key "MODULATION OFF" at the right moment the required strobe line will be selected. The display shows then e.g.:

STRO 08 - 1

which means that the output lines of the shift registers controlled by strobe line 8 show a specific bit-pattern. If MODULATION OFF was pressed once for a short moment all output lines of the shift registers change their state. Now the display shows:

STRO 08 - 0

Each time the MODULATION OFF-key is pressed for a short moment, the states of these output lines will be inverted. If MODULATION OFF is pressed for longer than about 1 second, this subprogram will be left and the display shows again:

STRO  $x$

If the key MODULATION OFF is pressed again for longer than about 1 second, the program will return to the test menu.

This strobe test serves fault finding in the internal C-bus system. Measuring points, positions of ICs and measuring values are given in the following tables.

By strobe lines controlled ICs show the following bit patterns during STROBE-test:

Bit pattern ICs HEF 4094								
Pin no.	4	5	6	7	14	13	12	11
Strobe 'x' - 0	0	1	0	1	0	1	0	1
Strobe 'x' - 1	1	0	1	0	1	0	1	0

Association of these ICs:

Strobe line	Controlled ICs (Pos. no.)	Location
Strobe 7	307, 308, 309, 310, 311	"DFS", unit 2
Strobe 8	301, 302, 303	"Output Amplifier", unit 1
Strobe 9	302	"Modulator", unit 1
Strobe 11	301	"PLL", unit 1
Strobe 15	311	"IEC-bus, function and address" CPU, unit 2

Bit pattern IC HEF 40373								
Pin no.	2	5	6	9	12	15	16	19
Strobe 'x' - 0	0	1	0	1	0	1	0	1
Strobe 'x' - 1	1	0	1	0	1	0	1	0

#### Association of this IC

Strobe line	Controlled IC (Pos. no.)	Location
Strobe 14	308	"IEC-bus out" CPU, unit 2

Strobe lines 6, 10, 12 and 13 are not used and have no control function.

#### TEST 5 : IEC-bus test

The display shows the indication

IEC BUS

Each character sent from the controller via the IEC (IEEE)-bus will be decoded and displayed with its hexadecimal code, e. g.

ASCII 'A' indication 41 H  
 ASCII '3' indication 33 H  
 etc.

The device address of the PM 5191 is fixed to 20.

With the key MODULATION OFF the program returns to the test menu.

## 6. CIRCUIT DESCRIPTIONS

### 6.1. DIGITAL FREQUENCY SYNTHESIZER/U2

#### Signal Synthesizer

The primary signal of PM 5191 is generated in the digital frequency synthesizer (DFS). At the output of the digital section of the DFS the signal is presented as a sequence of 9-bit binary numbers. The digital samples of the signal are then converted to analogue voltages by means of a fast DAC.

The frequency of the DFS is determined by a 40-bit frequency word which is sent from the CPU to the shift registers 307 – 311. The bit parallel shift register outputs are connected with the phase accumulator inputs. The phase accumulator is clocked by 8.5899 MHz from the clock generator. With each clock pulse the 9-bit phase accumulator output is incremented by the value of the frequency word. The resulting sequence of binary numbers represents a periodic sawtooth wave. By intermittent one's complementing (complementer 1) the signal is converted to a triangular wave. The samples of this signal are used as addresses for reading out a sine table ROM. The output is representing sine wave values for the first quarter period (4). By intermittent one's complementing in complementer 2 this signal is converted to a full sine wave (7).

The phase accumulator is functionally divided into two parts. The upper part consists of the adders 312 – 319 and the D-registers 322 – 326 for the frequency range 1 mHz – 2.147 MHz. Frequency values for this range are sent in the 1 - 2 - 4 - 8 code. The lower part consists of the adders 320 and 321, the NOR gate 305 and the D-register 326 and covers the range 0.1 – 1 mHz. For this range the frequency values are applied in the Excess - 3 code which generates a 4-bit binary number with decimal value from 0 to 9 (carry at values > 9).

The upper part of the phase accumulator generates a sequence of 33 bit binary numbers from 0 to  $2^{33} - 1$ . With each clock pulse the output is incremented by the value of the input frequency word. When reaching the upper limit the accumulator output resets and continuing incrementing starts again at zero. This results in a cyclic sequence of binary numbers which have a sawtooth wave form character. The frequency is  $f_g = 1/T = 0.1 \cdot N \cdot f_c \cdot 2^{-L}$  where N is the decimal value of the frequency word,  $f_c$  the clock frequency (8.5899 MHz  $\approx 2^{33}$  mHz) and L the length of the 1 - 2 - 4 - 8 coded part of the phase accumulator (33 bits). The factor 0.1 results from the lower, excess-3-coded part which represents values of max. 10 (carry at values  $> 9$ ).

The upper 10 bits of the phase accumulator are used for the subsequent signal processing. It is the actual accumulator output. The samples of the lower 8 bits of them represent a sawtooth wave with the period  $T/4$  (1A). The upper two of the 10-bit accumulator output (signum bit (2), quadrant bit (3) ) determine the quadrant in which the vector of the DFS output signal (7) is actually located (3a). In completer 1 (EXCLUSIVE-OR gates 331, 332) the 8-bit output is inverted during the second and fourth quarter period. The resulting signal (5) is fed to the sine/triangle selector (ICs 336, 337) and parallel to the address lines of the sine-ROM in which the sine wave values for the first quarter period ( $0 - \pi/2$ ) are deposited.

For generating the wave form triangle the output of complementer 1 is fed directly to the sine/triangle selector by-passing the sine ROM. Thus the sawtooth signal (5) applied to complementer 2 results in the wave form (6a).

For sine wave the output data of the sine ROM (4) is picked up by the sine/triangle selector and routed to complementer 2 resulting in wave form (6b). By adding the signum bit (2) as the 9th bit, it results in wave form 7.

When generating positive or negative sawteeth the value of the binary frequency word at the phase accumulator input is halved – thus the sawtooth period at the phase accumulator output is doubled.

For positive going ramps control signal “a” is LOW. Therefore bits  $\emptyset$  – 7 are routed through completer 1 without inversion to buffers 333 and 334. After passing sine triangle selector 336/337, the buffer 338/339 and completer 2 without inversion (“b” =  $\emptyset$ ) the signal is latched to the output by the D - FFs 342/343. The ninth bit at output 2/342 is directly derived from bit 8 of the phase accumulator through MUX 347 and the buffers 333 and 338 (= signal “c”).

For negative going ramps one difference is that control signal “a” is HIGH. Therefore the signal (bit  $\emptyset$  – 7) is inverted by completer 1. The second difference is that the ninth output bit (= “c”) is inverted by EXCLUSIVE-OR gate 327 (pins 8, 9, 10) at input pin 2 of MUX 347.

With LOW at the reset input the phase accumulator output can be set to zero. After reset is switched back to HIGH, the signal generation starts again in the way as described before.

## DAC

The binary signal coming from completer 2 via buffers 342, 343 is converted to an analog voltage in the DAC (see fig. below and fig. 37).

At the DAC inputs the drivers 344, 345 are located which are controlling the current switching differential transistor stages 403 - 404, 406 - 407 . . . 427 - 428. The DC-currents (each 5.85 mA =  $I_\emptyset$ ) are generated by individual circuits. The MSB (bit 8) - current source for instance includes transistor 427 and one OP of IC 346. The bit 7 - current source includes transistor 424 and the other OP of IC 346. The remaining current sources use also this second OP of IC 346. The individual currents – if switched on – are routed to the corresponding nodes N $\emptyset$  – N8 of the R – 2R ladder shown below. The input impedance of each node is 2R/3, with R = 619  $\Omega$  (2R/3 = 412.67  $\Omega$ ). Therefore each current – if switched on – is building up the same voltage at the corresponding node ( $I_\emptyset * 2R/3 = 2.41$  V). The transformation to the output depends on the node position in the ladder. Generally from node n to node n+1 the voltage is divided by two. Thus for instance the voltage at node N3 (bit 3) is transformed to the output node N8 by the factor  $2^{-(8-3)} = 1/32$ . The output voltage of the ladder at node N8 is filtered by the anti alias low pass filter 803, 804, 559 – 562. This filter with a passband of about 3 MHz suppresses especially the spectral contents at both sides of the clock frequency (8.5899 MHz). The output signal is buffered by the transistors 430, 431.

For deglitching purposes of the DAC the current switching point of bit 8 can slightly be shifted with the trimpot 689 versus the current switching points of bits 0 – 7. The latter switching points are set with trimpot 676. By an iterative calibration procedure with both these trimpots the sine wave distortion gets minimized.

## 6.2. MODULATOR / U1

By the VOLTAGE CONDITIONER (IC 301 and additional components) the positive and negative DFS sawtooth wave are halved in amplitude and shifted in dc, resulting in unipolar signals. The sine wave or the triangular wave is routed through the VOLTAGE CONDITIONER without modification. By the SELECTOR I (relais 810, 811) either the output signal of the VOLTAGE CONDITIONER (sine, triangle, sawtooth) or the square wave of the PULSE GENERATOR (conditioned by transistors 359 and 361) is routed directly or through the AMPLITUDE MODULATOR via relay contacts (813 – 815) to the AMPLIFIER unit.

In internal AM mode the modulation signal is derived from the MODULATION OSCILLATOR (IC 304 and additional components), a 'Wien-bridge' oscillator. The modulation signal, a sine wave of constant frequency (1 kHz) and amplitude (0.3 Vrms), is fed to the AMPLITUDE MODULATOR through SELECTOR II (IC 303). Alternatively, in external modulation mode, the modulation signal is supplied from an external source via the input socket MODULATION.

The AMPLITUDE MODULATOR (IC 305), an analogue four-quadrant multiplier, multiplies the VOLTAGE CONDITIONER output signal or the square wave by the internal or external modulation signal. The modulated signal is fed to the AMPLIFIER unit.

The VOLTAGE CONDITIONER and the AMPLITUDE MODULATOR are controlled by the CPU via shift register (302).

## 6.3. PULSE GENERATOR / U1

### 1. Square wave generation

According to fig. 30 (over-all block diagram) and fig. 43 (circuit diagram) the section of the PULSE GENERATOR, which generates the primary square wave, fed to the AMPLIFIER, comprises the following subsections:

- ZERO CROSSING DETECTOR, IC 301,
- CONTROL CIRCUITRY, IC 305, Transistor 351,
- SQUARE WAVE CONDITIONER, Transistors 352 . . . 355.

#### Zero crossing detector

By resistors 602, 605, 606 a slight hysteresis is implemented for accurate transitions without glitches at the zero crossings of the DFS input signal.

The ZERO CROSSING DETECTOR output signal is ANDed with the PULSE SELECT from transistor 351. Only if square wave is programmed the SQUARE WAVE CONDITIONER will be active. The input signal for the TTL OUTPUT-STAGE is not affected by the PULSE SELECT signal and routed directly from the ZERO CROSSING DETECTOR to the TTL OUTPUT-STAGE.

The SQUARE WAVE CONDITIONER converts the TTL signal of IC 305 / pin 6 to a square wave, accurate in shape and amplitude (about 2.4 Vpp). Trimpots 624 and 627 are adjusted for accurate positive and negative amplitudes at the generator output.

### 2. TTL output voltage generation

The output voltage of IC 305 / pin 8 is fed to the TTL OUTPUT STAGE with the transistors 356 . . . 358. The TTL OUTPUT is present in all waveform modes and not inhibited by IC 305.

## 6.4. AMPLIFIER / U 1

As depicted in the over-all block diagram fig. 30, the AMPLIFIER includes the sub-sections

- AMPLITUDE CONTROLLER
- POWER AMPLIFIER
- STEP ATTENUATOR
- DC GENERATOR

### 1. AMPLITUDE CONTROLLER

As depicted in the figure below, the input amplitude  $V_i$  of the AMPLITUDE CONTROLLER is fixed to  $V_i = 1.90$  V for sine, triangle and square waves or  $0.95$  V for sawtooth waves. The output amplitude  $V_A$  is related to  $V_i$  corresponding to  $\frac{V_A}{V_i} = g_i \cdot Y_{tot} \cdot R_f$

In the simplified circuit diagram  $Y_{tot}$  depends on those resistors of the switched resistor network which are connected to the virtual ground of the current to voltage converter input. The resistors  $R_1, \dots, R_9$  are in accordance with  $1/Y, 2/Y, 4/Y, \dots, 128/Y, 45/Y$ , where  $1/Y = 525 \text{ k}\Omega$ .

Thus  $\frac{V_A}{V_i} = g_i \cdot N \cdot Y \cdot R_f \approx 0.0087 \cdot N$

$N$  is an integer between 0 and 300 determined by the positions of the switches  $S_1, \dots, S_9$ . The related weights of the switches are 1, 2, 4, ..., 128 for  $S_1$  to  $S_8$  and 45 for  $S_9$ .

Example:  $N = 100$

In this case switches  $S_3, S_4$ , and  $S_5$  are closed. Thus  $N = 4 + 32 + 64 = 100$  and  $V_A/V_i = 0.87$ , or  $V_A = 1.7$  (0.85) V resp. In the real circuitry  $R_1^*$  to  $R_4^*$  are not discrete serial resistors but presented by resistor T-sections. E. g.

$$R_1^* = \frac{1}{Y} = R_{611} + \frac{R_{620} (R_{611} + R_{624})}{R_{624}}$$

The serial switches  $S_1, \dots, S_9$  are realized by the FETs 329, 325, ..., 339. The FETs 322, 324, ..., 338 are adapted for constant load of the input buffer, independently of the programmed amplitude. They are switched on/off inversely to 323, 325 ... 339. In the switch-off state the gates of the serial FETs are biased to about  $-10$  V by the resistors of the arrays R764 ... 767.

The collector-output currents of the current to voltage converter differential input stage (T340 ... 343) are routed directly respectively via current mirror (T370, 371) to the emitters of the common-base stages T344 and T345. By the emitter-follower T346, 347 the collector-output voltage of T344, 345 is buffered.

## 2. POWER AMPLIFIER

The AMPLITUDE CONTROLLER output is split by the POWER AMPLIFIER input buffer (T348 – 353) into two paths with opposite dc voltages, and supplied to the common-emitter stage (T354, 355). The output currents are fed to the emitters of the common-base stage (T356, 357). The collector output currents are routed to the inner 50  $\Omega$  resistor, made up by the resistors 721 – 732.

simplified circuit diagram  
of the POWER AMPLIFIER

Some DC-potentials of the AMPLITUDE CONTROLLER and POWER AMPLIFIER section

AMPLITUDE CONTROLLER		POWER AMPLIFIER	
measuring point	measuring value (Vdc)	measuring point	measuring value (Vdc)
base of T370/371	8	base of T348/349	~ 0
base of T344	4	base of T350	– 0.7
base of T346	~0	base of T352	2.9
		base of T354	3.5
		emitter of T354	2.9
		base of T372	21.5
		collector of T372	19
		emitter of T372	22
		base of 358	17.6
		base of 360	18.2

(all voltages measured to ground)

### 3. STEP ATTENUATOR

The STEP ATTENUATOR includes two resistor pi-sections, each symmetrically matched to  $50 \Omega$ . Switching is performed by 'Reed-contact relais' controlled by shift register 303 through drivers 311.

Function table of STEP ATTENUATOR switches

switch att.	K1, K3	K2, K4	K5, K7	K6, K8
0 dB	x	o	x	o
20 dB	x	o	o	x
40 dB	o	x	o	x

x : closed     o : open

### 4. DC GENERATOR

Primary control of the DC GENERATOR is performed by the DAC (IC 307). The DAC is set by shift register 302 to output currents  $I_0$  at pin 4 from 0 to about  $\frac{200}{255}$ .  $I_{ref} = 0.55 \text{ mA}$  proportional to the decimal equivalent 0 – 200 of the binary shift register output ( $I_{ref} \approx 0.71 \text{ mA}$ , current into pin 14 of IC 307). If the decimal equivalent is 100, i. e. DC  $\approx 0 \text{ V}$ ,  $I_0$  is compensated by the constant current  $I_c \approx \frac{0.55}{2} \text{ mA}$  via resistors 697, 698. Hence, in this situation no current is drawn from the input (pin 6 of IC 308) of the dc generating circuitry ( $I_1 = I_2 = 0$ ).

For positive output current  $I_{out}$ , i. e. positive dc voltage at the generator output, the following conditions are valid:

shift register output  $> 100$  (decimal)

$$I_0 > I_c \Rightarrow I_1 > 0 ; I_2 = 0$$

The upper section (transistor 362, IC 309 etc.) of the circuitry is translating  $I_1$  to  $I_{out}$  according to:

$$I_{out} = (I_0 - I_c) \cdot A_1 \cdot A_2$$

wherein

$$A_1 = \frac{I_4}{I_1} \text{ and } A_2 = \frac{I_{out}}{I_4}$$

are the current gain factors of the transistor 362 stage and the IC 309 current translator stage respectively. These gains are

$$A_1 \approx \frac{R699}{R702} + 1 \approx 17.96 ; \quad A_2 \approx \frac{R701}{R711-713} \approx 41.35$$

For negative output current  $I_{out}$ , i. e. negative dc output voltage, the following conditions are valid:

shift register output  $< 100$  (decimal)

$$I_0 < I_c \Rightarrow I_1 = 0 ; I_2 > 0$$

The lower section (transistor 363, IC 310 etc.) of the circuitry is translating  $I_2$  to  $I_{out}$ .

The generator output voltage  $V_{out}$  is given as the voltage drop by  $I_{out}$  at the amplifier output resistance  $R_o$  (721 – 732).

simplified circuit diagram  
of the DC GENERATOR

The schedule shows current and voltage values of the DC GENERATOR in dependence on the shift register output.

shift reg. output pos. 302 (decimal)	$I_c$ (mA)	$I_0$ (mA)	$I_1$ (mA)	$U_{702}$ (V)	$U_{701}$ (V)	$U_{711-713}$ (V)	$I_2$ (mA)	$U_{703}$ (V)	$U_{704}$ (V)	$U_{714-716}$ (V)	$I_{out}$ (mA)	Gen. output volt. (V)

## 6.5. CPU / U2

The CPU of the PM 5191 contains the  $\mu$ -processor 8031 with all drivers, decoders, RAM- and PROM memory, clock generator, IEC-bus interface and the strobe-decoder.

The multiplexed address/data bus (AD0 – AD7) of the processor 318 supplies the address inputs A0 – A7 of the PROM-memory 315 via the address latch 314 (74LS363), the inputs A8 – A13 are supplied directly from the processor (P20 – P25). Data from the PROM is fed from the outputs O0 – O7 via the lines AD0 – AD7 directly to the processor, this transfer is controlled with the output PSEN (program store enable) from the processor driving the input OE of the PROM.

The memory circuit 324 serves the storing of the actual parameter set. Communication with them takes place via the internal serial  $I^2C$  bus which consists of a data line SDA and a clock line SCL. The principle of the data transfer between processor and the RAM-memory is shown in the following diagram.

The two lines SDA and SCL of the C-bus serve the communication with the remaining units. The data information of the line SDA is clocked into the shift register of each unit, the according strobe signal following this data sequence latches the data information in the selected shift register and presents the transmitted information in parallel form at the output lines of this circuit. The required strobe signals are generated with the strobe-decoder 312 which is controlled again from the processor via the lines P20 – P23 and the signal WR.

### Internal communication via $I^2C$ - and C-bus

Converting the serial information to a parallel one the parallel output presents the decoded commands.

The clock signals for processor and IEC controller as well as a 100 kHz signal for the internal timer are generated in the 'clock generator' circuitry. This part of the CPU consists of the crystal 801, the inverter 317 and the decimal counter 319. The 10 MHz clock from the inverting buffer is fed to input XTAL 1 of the processor, furthermore divided by 5 with the decimal counter 319 and then fed to the IEC-controller 306. After further dividing by 20 the output 7 of the counter deliveres the 100 kHz signal T0 for the timer.

Remote control of the PM 5191 follows via the IEC-interface which consists of the controller 306, the bus drivers 301 – 304, the buffers 307, 308 and the shift registers 309 – 311. Input data (control commands) from the IEC-bus connector are fed to the data bus AD0 – AD7 via the bidirectional bus drivers 303 and 304 and buffer 307. Output data (learn- and identification mode) are accordingly fed to the IEC-bus via buffer 308 and the bus drivers 303 and 304. Data direction and enable of the buffers are controlled by the IEC-bus controller 306 via the output Ota (other talk address) and by the processor with the signal 'strobe 14'.

The listener/talker addresses and the interface parameters necessary for the communication are sent to the IEC-controller in serial form. The microprocessor sends these informations via the C-bus with the help of the signal STR 15 to the shift register 311. The parallel outputs of this circuit supply again the parallel inputs of the shift registers 309 and 310 by means of which addresses and interface parameters are transferred to input ISR (input shift register) of the IEC-bus controller. This transfer action is controlled from the controller circuit, the repetition rate is 125 kHz (= 2 MHz/16).

Each data string for the shift registers 309 and 310 contains the IEC device-address and one bit for SRQ on or off. The data string entered from the IEC controller 306 via input 'ISR' has a length of 11 bits, not required bits at the inputs of ICs 309/310 are fixed to ground. Input GTL of these circuits – pin 15 of IC 309 – is controlled directly from the key LOCAL at the front panel. Pressing this key causes the IEC controller 306 to switch back to the local mode.

## 6.6. KEYBOARD DISPLAY UNIT / U3

Unit 3 of the synthesizer PM 5191 contains LEDs keys and display elements with their concerning driver/decoder circuits. Data transfer from the CPU to the keyboard/display unit takes place via the C-bus (SDA, SCL, Strobe 1, 3 – 5), input data from the keyboard are sent as a sequence of 12 pulses from the keyboard encoder 353 via the line SKC to the CPU. The key 'LOCAL' is directly led to the IEEE/IEC interface on unit 2 via line GTL.

Display data are sent in 34 bit data blocks via the C-bus to the according part of the display unit, selection (= addressing) of this part is done with one of the strobe signals STROBE 1 or STROBE 3 – 5. During the data transfer from the CPU to the keyboard/display unit the according strobe line is set and a data block is loaded into the shift register with the clock signal SCL. The last bit at the data input shifts the complete data set into the latch register and therewith to the display elements/LEDs via the buffer stage.

Each of the five strobe lines controls the data transfer to one of the display groups:

STROBE 1 display circuit 408 for amplitude, Vdc, address and the LEDs in the keys 'Vrms' and 'ADDRESS'

STROBE 2 not used

STROBE 3 display circuit 406 for frequency display (right part) and the LED in the key 'FREQ'

STROBE 4 display circuit 405 for frequency display (left part)

STROBE 5 LED driver circuit 352

Voltage supply for the LEDs and displays comes from the + 5 V which is reduced to + 3 V (V<sub>L</sub>) by means of the transistor 301 and the resistors 602 and 603

the transistor 301 is placed behind the front plate at a spacing piece beside the socket TTL OUT.

Brightness of the LEDs/displays is adjusted with a reference voltage at the inputs BC (brightness control) of the driver circuits. These reference voltages are derived from the + 24 V supply by means of the resistors 604 – 608 feeding currents into the BC-inputs.

Input from the keyboard takes place with the help of the keyboard encoder IC 353 (SAA 3007) which controls the 8 x 8 keyboard matrix and sends the keycode in serial form from the output REMO via line SKC to the CPU. During the rest condition the sense lines SEN0 – SEN6 are 'high', the drive lines of the matrix DRV0 – DRV6 are 'low', the last drive line is fixed to ground.

When a key is pressed the according sense line is forced to 'low', the internal logic of the encoder starts the scan of the matrix and transmits a sequence of 12 pulses whereby the distance between two pulses means binary "0" or "1".

Each time a key is pressed such a bit sequence must be measurable at line SKC (pin 10 of the CIS connector). The toggle bits of this message are incremented by 1 each time when a key is pressed. Thus it is possible to distinguish between a key being pressed several times or once for a longer time.

The device address is fixed to "000" and the last 6 bits show the following pattern by pressing the corresponding key

Key	Connection between	Key code	Key	Connection between	Key code
~	DRV0 – SEN0	000000	Vdc	DRV3 – SEN3	011011
↖	DRV0 – SEN1	001000	Vpp	DRV3 – SEN4	100011
↙	DRV0 – SEN2	010000	△LEVEL	DRV3 – SEN5	101011
↖	DRV1 – SEN0	000001	+/-	DRV4 – SEN3	011100
↖	DRV1 – SEN1	001001	dBm	DRV4 – SEN4	100100
AC OFF	DRV1 – SEN2	010001	-STEP	DRV4 – SEN5	101100

			4	DRV4 – SEN6	110100
			5	DRV5 – SEN6	110101
			6	DRV6 – SEN6	110110
			7	⊥ – SEN6	110111
			8	DRV0 – SEN7	111000
			9	DRV1 – SEN7	111001
			“●”	DRV2 – SEN7	111010
			ENTER	DRV3 – SEN7	111011

The clock for the keyboard encoder is generated with the ceramic resonator 860. During the rest condition – i. e. no key is pressed – there is no signal at input 11 or 12 of the keyboard encoder. When any key – except LOCAL – is pressed, the clock supply will be activated and a signal with a frequency of 455 kHz and an amplitude of 4,5 Vpp can be measured at pin 11 or 12. By pressing a key only once for a short moment the clock will be switched on for approx. 170 ms., pressing a key for longer will keep the clock supply switched on as long as the key is pressed.

The key MOD OFF contains one more switch contact which is commonly connected to line ENK (enable keyboard), to start the diagnostic program (see chapt. 5) during switching on of the instrument.

## 7. ACCESS TO PARTS

### 7.1. TOP AND BOTTOM COVERS (DISMANTLING THE INSTRUMENT)

Before opening the instrument unplug mains connector, take note of chapter 1.5..

- Loosen the cross-slotted screws **(A)** (Fig. 7-1) at the rear
- Pull top cover **(B)** as shown in figure 7-1.
- The procedure to remove the bottom cover **(C)** is the same as above.

### 7.2. FUSE, MAINS TRANSFORMER

For mains voltage setting and fuses and the assigned safety instructions see chapter 2.

### 7.3. UNIT 1 AND UNIT 2

For access to the upper side of unit 2 and the bottom side of unit 1 it is only necessary to remove the top cover respectively the bottom cover of the instrument (see chapter 7.1.).

To reach the upper side of unit 1 and the bottom side of unit 2 proceed as follows:

- Unplug the connector **(G)** (Fig. 7-5) on the right hand side of unit 2.
- Remove 2 screws **(A)** (Fig. 7-5) at the sides of the instrument.
- Lift the pcb as arrow **(C)** shows in Fig. 7-5. (If it is heavy to move the pcb, loosen the screws at the pivot a little bit.).
- Fixing unit 2 in an upright position insert screw **(A)** in position **(H)** (Fig. 7-5).
- The other steps shown in fig. 7-5 are not necessary to reach unit 1 + 2.

### 7.4. FRONT-PANEL EDGING

- Remove covers (chapt. 7.1.).
- Lift the profile ornament **(A)** (Fig. 7-2) with a small screw driver.
- Remove the screws **(B)** (Fig. 7-2).
- Remove the edging **(C)** (Fig. 7-2).
- For the bottom side the same procedure applies.

- Remove screws **B** (Fig. 7-3)
- Remove side pieces **A** (Fig. 7-3)

Fig. 7-3

## 7.5. TEXT PLATE

The text plate **A** (Fig. 7-4) is fixed by three parts of doublesided adhesive tape **B** (Fig. 7-4)

- To remove the text plate insert carefully a screwdriver near the tapes and move the screwdriver as shown in Fig. 7-4.
- Steps described in chapters 7.1 and 7.4. are necessary before.

Fig. 7-4

## 7.6. UNIT 3 (KEYBOARD AND DISPLAY)

At first steps described in chapters 7.1., 7.4. and 7.5. must be done

- Unplug connector **G** (Fig. 7-5)
- Loosen all screws **F** (Fig. 7-5) at the front of the instrument
- Pull carefully frontplate **E** (Fig. 7-5) forwards, take care of the wires of the BNC-connectors and the main switch
- Remove unit 3 **D** (Fig. 7-5)
- The other steps shown in this figure are not necessary to reach unit 3.

Fig. 7-5

## 7.7. CARRYING HANDLE

- Lift the carrying handle.
- Prise off carefully both plastic profile strips next to the handle in the similar way as the profile ornament of the front-panel edging shown in Figure 7-2.
- Loosen cross-slotted screws of the holder for handle.

## 7.8. HANDLE ASSEMBLY FOR RACK MOUNTING

- Remove top and bottom covers as described in chapter 7.1.
- Loosen screws **(B)** (Fig. 7-6).
- Remove side piece **(C)**.
- Fit handle **(A)**, refit screws **(B)**.
- For the right hand side the same procedure applies.
- Close the instrument

Fig. 7-6

## 7.9. VIEW INTO THE OPEN INSTRUMENT

PM 5191 without top cover

## 8. CHECKING AND ADJUSTING

### 8.1. GENERAL INFORMATION

The following information provides the complete check and adjustment procedure for the instrument. As various control functions are interdependent, a certain order of adjustment is often necessary. The procedure is, therefore, presented in a sequence which is best suited to this order, cross-reference being made to any circuit which may affect a particular adjustment.

Before any check, the instrument must attain its normal operating temperature.

- Warm-up time under average conditions is 30 minutes.
- Adjustments should be made after 2 hours
- Ambient temperature  $(23 \pm 1)^\circ\text{C}$
- Mains voltage, nominal values  $\pm 10\%$
- The cabinet must be closed.\*
- Where possible, instrument performance should be checked before an adjustment is made.
- All limits and tolerances given in this chapter are calibration guides, and should not be interpreted as instrument specifications unless they are also published in chapter 1.2. of the Operating Manual.
- Tolerances are given for the instrument under test and do not include test equipment error.
- If not explicitly stated otherwise, the voltage potentials refer to the relevant contact measured against measuring earth.

### 8.2. RECOMMENDED TEST EQUIPMENT

The following instruments are necessary to provide check and adjustment of the PM 5191

- $50\ \Omega$  termination resistor PM 9581 (1 W)
- wide band oscilloscope ( $t_r \leq 3\ \text{ns}$ )
- DC-voltmeter: resolution  $\leq 100\ \mu\text{V}$  e. g. PM 2534
- counter 50 MHz, intervall-measurements, 8 digits resolution, e. g. PM 6665
- rms voltmeter: resolution  $1\ \mu\text{V}$ ,  $f_{\text{max}} = 2\ \text{MHz}$  e. g. Fluke 8920 A; the connection cable together with the termination resistor must have an impedance of exactly  $50\ \Omega$
- distortion meter e. g. PM 6309
- modulation meter e. g. Rhode + Schwarz FAM with 20 dB attenuator
- service kit
  - consisting of notch filter 100 kHz, low pass filter 5 kHz, adjustment covers and two adapter cables; to be ordered from SC Hamburg without service code number

\* For adjustments special covers with holes for the adjusting elements are required. This parts are included in the service kit.

### 8.3. TABLE OF CHECKS AND ADJUSTMENTS

step	objective	check "adjust"	operation parameters, settings	adjusting elements	measured value, value to be adjusted	test point, output, measuring instruments	open output/ 50Ω term.	comment
	<b>POWER SUPPLY ADJUSTMENT</b>							
1	+ 5 V supply	c	~ 1 kHz/15 Vpp	—	5 ± 0.25 V	T1 pin 6, DC-voltmeter (DVM)	—	
2	± 24V supply	c (a)	~ 1 kHz/15 Vpp	604, 612, power supply	± 24 ± 0.05 V	T1 pin 4, 5, DC-voltmeter (DVM)	—	
3	+ 20V supply	c (a)	~ 1 kHz/15 Vpp	607, power supply	+ 20 ± 0.05 V	T1 pin 3, DC-voltmeter (DVM)	—	
4	± 10V supply	c (a)	~ 1 kHz/15 Vpp	618, 621, power supply	± 10V ± 0.05 V	T1 pin 1, 2, DC-voltmeter (DVM)	—

## 9. SAFETY INSPECTION AND TESTS AFTER REPAIR AND MAINTENANCE IN THE PRIMARY CIRCUIT

### 9.1. GENERAL DIRECTIVES

- Take care that creepage distances and clearances have not been reduced
- Before soldering, wires:
  - should be bent through the holes of solder tags, or wrapped round the tag in the form of an open U, or, wiring ridigity shall be maintained by cable clamps or cable lacing.
- Replace all insulating guards and -plates.

### 9.2. SAFETY COMPONENTS

Components in the primary circuit may only be renewed by components selected by Philips, see also chapter 10.

### 9.3. CHECKING THE PROTECTIVE EARTH CONNECTION

The correct connection and condition is checked by visual control and by measuring the resistance between the protective-lead connection at the plug and the cabinet/frame. The resistance shall not be more than  $0.5 \Omega$ . During measurement the mains cable should be moved. Resistance variations indicate a defect.

### 9.4. CHECKING THE INSULATION RESISTANCE

Measure the insulation resistance at  $U = 500$  Vdc between the mains connections and the protective lead connections. For this purpose set the mains switch to ON. The insulation resistance shall not be less than  $2 M\Omega$ .

Note:

$2 M\Omega$  is a minimum requirement at  $40^\circ C$  and 95 % relative humidity. Under normal conditions the insulation resistance should be much higher (10 to  $20 M\Omega$ ).

### 9.5. TEST AFTER REPAIR AND MAINTENANCE

This part of the checking – and adjusting procedure represents the final check of the PM 5191. Bottom and top cover of the cabinet must be closed and the instrument must be warmed up for at least 2 hours. The check contains measurements of DC-levels, amplitudes and frequencies on following their specifications and furthermore test of modulation function. The sequence of the measurements is free selectable.

## 9.5.1. Frequency measurements

Object	Frequency setting	Toleranz	Measurement point
Frequency (carrier)	1 MHz	± 0.8 Hz	OUTPUT (50 Ω)
mod. Frequency	INT (fm 1 kHz fixed)	± 25 Hz	MOD OUT

## 9.5.2. Checking of the square-wave

Frequency	Amplitude	Measurement
2 MHz	25 Vpp	rise/fall time < 35 ns aberrations < 3 % ± 20 mVpp

## 9.5.3. Modulation measurement

Measurement point: BNC-connector OUTPUT (50 Ω termination)

Frequency	Modulation	Object	Tolerance
2 MHz	INT	mod. depth* (30 % fixed)	28.5 % ... 31.5 %

\* (For measurement with Rhode &amp; Schwarz FAM use 20 dB attenuator)

## 9.5.4. DC-measurements

Measurement point: BNC-connector OUTPUT

Waveform	Frequency	Modulation	AC	DC	Tolerance of DC-output (open circuit)
AC OFF	1 kHz	OFF	0	0	± 25 mV
AC OFF	1 kHz	OFF	0	-10 V	± 225 mV
AC OFF	1 kHz	OFF	0	- 5 V	± 125 mV
AC OFF	1 kHz	OFF	0	+ 5 V	± 125 mV
AC OFF	1 kHz	OFF	0	+10 V	± 225 mV
~	1 kHz	OFF	4, 5, ..., 30 Vpp	0	setting ± 70 mV
~	1 kHz	OFF	5, 10, ..., 30 Vpp	0	setting ± 100 mV
~	1 kHz	EXT	30 Vpp	0	± 80 mV

## 9.5.5. AC-measurements

Measurement point: BNC-connector OUTPUT (50 Ω termination)

Waveform	Frequency	Modulation	Setting Vpp	≈ Vrms with 50 Ω termin.	Tolerance	≈ max / min
~	1 kHz	OFF	0.003	0.530 mV	± 10 %	0.583 / 0.477 mV
~	1 kHz	OFF	0.01	1.768 mV	± 4 %	1.839 / 1.697 mV
~	1 kHz	OFF	0.02	3.536 mV	± 3 %	3.642 / 3.30 mV
~	1 kHz	OFF	0.05	8.839 mV	± 2.5 %	9.060 / 8.618 mV
~	1 kHz	OFF	0.1	17.678 mV	± 2.5 %	18.120 / 17.236 mV
~	1 kHz	OFF	0.2	35.356 mV	± 2.3 %	36.169 / 34.543 mV
~	1 kHz	OFF	0.3	53.034 mV	± 2.4 %	54.307 / 51.761 mV
~	1 kHz	OFF	3.0	0.5303 V	± 1.5 %	0.5383 / 0.5223 V
~	1 kHz	OFF	30.0	5.3033 V	± 1.2 %	5.3669 / 5.2397 V
~	1 kHz	OFF	2.0	0.3535 V	± 1.5 %	0.3588 / 0.3482 V
~	1 kHz	OFF	3.2	0.5657 V	± 1.2 %	0.5725 / 0.5589 V
~	1 kHz	OFF	4.0	0.7071 V	± 1.2 %	0.7156 / 0.6986 V
~	1 kHz	OFF	6.4	1.1314 V	± 1.2 %	1.1450 / 1.1178 V
~	1 kHz	OFF	8.0	1.4142 V	± 1.2 %	1.4312 / 1.3972 V
~	1 kHz	OFF	12.8	2.2628 V	± 1.2 %	2.2899 / 2.2356 V
~	1 kHz	OFF	16.0	2.8285 V	± 1.2 %	2.8624 / 2.7946 V
~	1 kHz	OFF	25.6	4.5255 V	± 1.2 %	4.5798 / 4.4712 V
~	1 kHz	OFF	20.0	2.8867 V	± 1.2 %	2.9213 / 2.8521 V
~	1 kHz	OFF	20.0	5.0000 V	± 1.5 %	5.0750 / 4.9250 V
~	1 kHz	OFF	10.0	1.4433 V	± 2 %	1.4722 / 1.4144 V
~	1 kHz	OFF	10.0	1.4433 V	± 2 %	1.4722 / 1.4144 V
~	10 kHz	OFF	30.0	5.3033 V	± 1.2 %	5.397 / 5.2397 V
~	200 kHz	OFF	15.0	2.6517 V	± 1.3 %	2.6862 / 2.6172 V
~	2.147 MHz	OFF	15.0	2.6517 V	± 4.5 %	2.7710 / 2.5324 V
~	2.147 MHz	OFF	1.0	0.1767 V	± 5 %	0.1855 / 0.1679 V
~	2.147 MHz	OFF	0.10	17.678 mV	± 6.5 %	18.827 / 16.529 mV
~	2.147 MHz	OFF	0.01	1.768 mV	± 7.5 %	1.901 / 1.635 mV
~	1.8 MHz	OFF	15.0	2.6517 V	± 4.5 %	2.7710 / 2.5324 V
~	1 MHz	OFF	15.0	2.6517 V	± 2 %	2.7047 / 2.5987 V
~	1 kHz	EXT	30.0	2.6517 V	± 2 %	2.7047 / 2.5987 V
~	10 kHz	EXT	30.0	2.6517 V	± 2 %	2.7047 / 2.5987 V

## 10. SPARE PARTS

### 10.1. GENERAL

The synthesizer/function generator PM 5191 is repaired on single component level. No complete boards and modules are available at Concern Service Eindhoven.

Loaded PROMs must be ordered directly via Philips Supply Center Hamburg (please note software version).

In case of difficult faults central repair facility of the complete instrument is possible on special request via repair procedure at Supply Center Hamburg.

Conversion of an existing instrument to a different version is not foreseen.

#### Standard Parts

Electrical and mechanical parts replacement can be obtained through your local Philips organisation or representative. However, many of the standard electronic components can be obtained from other local suppliers. Before purchasing or ordering replacement parts, check the parts list for value, tolerance, rating and description.

**NOTE:** Physical size and shape of a component may affect instrument performance, particularly at high frequencies. Always use direct-replacement components, unless it is known that a substitute will not degrade instrument performance.

#### Special Parts

In addition to the standard electronic components, some special components are used:

- Components, manufactured or selected by Philips to meet specific performance requirements.
- Components which are important for the safety of the instrument marked with 'S' in the parts list.

**ATTENTION:** Both type of components may only be replaced by components obtained through your local Philips organisation.

### 10.2. STATIC SENSITIVE COMPONENTS

This instrument contains electrical components that are susceptible to damage from static discharge. Servicing static-sensitive assemblies or components should be performed only at a static-free work station by qualified service personnel.

### 10.3. HANDLING MOS DEVICES

Though all our MOS integrated circuits incorporate protection against electrostatic discharges, they can nevertheless be damaged by accidental over-voltages. In storing and handling them, the following precautions are recommended.

**CAUTION:** Testing or handling and mounting call for special attention to personal safety. Personnel handling MOS devices should normally be connected to ground via a resistor.

### 10.4. SOLDERING TECHNIQUES

#### Working method:

- Carefully unsolder one after the other the soldering tags of the semi-conductor.
- Remove all superfluous soldering material. Use a sucking iron or sucking litze wire.
- Check that the tags of the replacement part are clean and pre-tinned on the soldering places.
- Locate the replacement semi-conductor exactly on its place, and solder each tag to the relevant printed conductor on the circuit board.

NOTE: Bear in mind that the maximum permissible soldering time is 10 seconds during which the temperature of the tags must not exceed 250° C. The use of solder with a low melting point is therefore recommended.

Take care not to damage the plastic encapsulation of the semi-conductor (softening point of the plastic is 150° C).

ATTENTION: When you are soldering inside the instrument it is essential to use a low-voltage soldering iron, the tip of which must be earthed to ground of the instrument.

Suitable soldering irons should have temperature control and different types of nozzles (pin point tips), e. g. Weller Magnastat WTCP or WECP, Ersa TC 70/24 V.

If a higher wattage-rating soldering iron is used on the etched circuit boards excessive heat can cause the etched circuit wiring to separate from the board base material.

In general use short-time heating with high tip temperature at a small point, avoid long time heating.

## 10.5. PARTS LIST PM 5191

### 10.5.1. Mechanical parts

#### Cabinet

Item	Quantity	Order number	Description
A	1	5322 447 91368	Top cover

## 10.5.3. Electrical Parts

Some parts are listed in chapter 10.5.2.

From LO-02 691 onwards the instruments are fitted with dustproof potentiometers. Altered values and service code no. see page 10-17.

All metal film resistors not listed are of type MR 25 ± 1 % 0.4 W (ordering code see end of this list).

\*1 Please order loaded PROM directly via Philips Supply Center Hamburg (note software version).

100 k $\Omega$	carb.	4822 100 10052		100 k $\Omega$	10878

Note: Potentiometer used for UNIT 1, AMPLIFIER, pos. no. 633; altered to 25 k $\Omega$ 

The dustproof potentiometers are mechanical compatible.

For instruments with CERMET and carbon potentiometers spare parts are available on stock too.

#### Brightness adjustment of displays

1. Open + 5 V supply of UNIT 3 at CIS-connector, pin 11, and connect an amperemeter. (It is recommended to use the extension cable of the service kit.)
2. Set the display you want to adjust to e. g. digit 1 (two segments) and measure current.
3. Set the display to e. g. 11 (two segments more than before) and measure current again. The difference may not exceed 10 mA per segment, in this case 20 mA; note that the decimal point is a segment too. Adjustment is done by resistor 604, 606 resp. 608.

Observe that no further display segments or LEDs are switched on or off, between both measurements.

PM 5191 from LO - 02 691 onwards  
is equipped with displays type SI 35035, serv. code no. 5322 130 90491

Distinction can easily be done by the space between the digits

- For instruments from LO - ... onwards (see above) you should only build in the type SI 35035.
- For instruments up to above-mentioned LO - no. it is recommended to use still type LTM 86 .... If the stock is empty a new display can be built in; for this adjustment to the same brightness is necessary for the new one.
- If you want to replace all displays by new ones, you may do so. In this case a new adjustment for each display is necessary.

**CODING SYSTEM OF FAILURE REPORTING FOR QUALITY**  
**ASSESSMENT OF T & M INSTRUMENTS**  
(b excl. potentiometric recorders)

The information contents of the coded failure description is necessary for our computerized processing of quality data.

Since the reporting of repair and maintenance routines must be complete and exact, we give you an example of a correctly filled-out PHILIPS SERVICE Job sheet.

Detailed description of the information to be entered in the various boxes:

①Country: **3 2** = Switzerland

②Day Month Year **1 5 0 4 7 5** = 15 April 1975

③Type number/Version **O P M 3 2 6 0 0 2** = Oscilloscope PM 3260, version 02 (in later oscilloscopes this number is placed in front of the serial no)

④Factory/Serial number **D 0 0 0 7 8 3** = DO 783 These data are mentioned on the type plate of the instrument

⑤Nature of call: Enter a cross in the relevant box

⑥Coded failure description

Location	Component/sequence no.	Category										
<table border="1" style="width: 100%; border-collapse: collapse;"> <tr><td></td><td></td><td></td></tr> </table>				<table border="1" style="width: 100%; border-collapse: collapse;"> <tr><td></td><td></td><td></td><td></td><td></td><td></td></tr> </table>							<table border="1" style="width: 100%; border-collapse: collapse;"> <tr><td></td></tr> </table>	
These four boxes are used to isolate the problem area. Write the code of the part in which the fault occurs, e.g. unit no or mechanical item no of this part (refer to 'PARTS LISTS' in the manual). Example: 0001 for Unit 1 000A for Unit A 0075 for item 75 If units are not numbered, do not fill in the four boxes; see Example Job sheet.	These six boxes are intended to pinpoint the faulty component. A. Enter the component designation as used in the circuit diagram. If the designation is alfa-numeric, the letters must be written (starting from the left) in the two left-hand boxes and the figures must be written (in such a way that the last digit occupies the right-most box) in the four right-hand boxes. B. Parts not identified in the circuit diagram: 990000 Unknown/Not applicable 990001 Cabinet or rack (text plate, emblem, grip, rail, graticule, etc.) 990002 Knob (incl. dial knob, cap, etc.) 990003 Probe (only if attached to instrument) 990004 Leads and associated plugs 990005 Holder (valve, transistor, fuse, board, etc.) 990006 Complete unit (p.w. board, h.t. unit, etc.) 990007 Accessory (only those without type number) 990008 Documentation (manual, supplement, etc.) 990009 Foreign object 990099 Miscellaneous	0 Unknown, not applicable (fault not present, intermittent or disappeared) 1 Software error 2 Readjustment 3 Electrical repair (wiring, solder joint, etc.) 4 Mechanical repair (polishing, filing, remachining, etc.) 5 Replacement (of transistor, resistor, etc.) 6 Cleaning and/or lubrication 7 Operator error 8 Missing items (on pre-sale test) 9 Environmental requirements are not met										

⑦Job completed: Enter a cross when the job has been completed.

⑧Working time: Enter the total number of working hours spent in connection with the job (excluding travelling, waiting time, etc.), using the last box for tenths of hours.

1	2
---	---

 = 1,2 working hours (1 h 12 min.)
